1. Receive Channel

■Performance Parts and Transmission Channels

This instrument contains two sound generators: one for SMF data playback (GM2/GS) and one for keyboard performance. Normally, data received at the MIDI In connector will control only the sound generator for SMF data playback. However by changing the MIDI IN Mode setting, you can also control the keyboard sound generator from MIDI In. MIDI IN For instructions on changing the MIDI IN mode, refer to the Owner's Manual. For instructions on controlling each sound generator, refer to the "Received data" section (p. 1).

○MIDI IN MODE

Mode	explanation
MODE 1	Control the instrument as a GM2/GS sound generator.
MODE 2	Channels 5 through 10 and Channels 12,14,15 are transmitted to the GM2/GS sound generator, and all other channels are transmitted to the keyboard sound generator. When the Pedal part tone has been selected, Channel 2 is transmitted to the sound generator used for the keyboard performance; if no tone has been selected, it is transmitted to the GM2/GS sound generator.

The correspondence between channels and parts in each mode is described below.

channel	MODE1	MODE2
1	GM2/GS	Solo
2	GM2/GS	Pedal
3	GM2/GS	Lower
4	GM2/GS	Upper
5-10	GM2/GS	GM2/GS
11	GM2/GS	Drums/SFX
12	GM2/GS	GM2/GS
13	GM2/GS	Nothing
14-15	GM2/GS	GM2/GS
16	GM2/GS	Control

■MIDI Channels on SMF Music Data

This instrument contains two sound generators. Commercial SMF music data is played back using the GM2/GS sound generator. The correspondence between channels and tracks when the AT's Track Mute function is used is described below.

Track	Channel
RHYTHM	10
ACCOMP	5, 6, 7, 8, 9, 11, 12, 13, 14, 15, 16
BASS	2
LOWER	3
UPPER	4
SOLO	1

When SMF music data created using the AT-60SL is used, the parts of the performance played by hand are transmitted to the sound generator used for the keyboard performance, and the automatic accompaniment portions (rhythm performances, Arranger) are transmitted to the GM2/GS sound generator.

The correspondence between channels and parts for SMF music data created using the AT-60SL is described below.

ch	part
1	Solo
2	Pedal/Accomp (Bass)
3	Lower
4	Upper
5-6	(blank)
7-9	Accomp
10	Accomp (Rhythm)
11	Drums/SFX
12	Accomp
13	Manual Percussion
14-15	Accomp
16	Control

2. Transmit Channel

■Keyboard and Transmit Channel

You can control external MIDI devices using the AT-60SL's MIDI Out connector. Data describing what is played on the Upper keyboard, the Lower keyboard, and the pedalboard is transmitted over MIDI channels for the respective parts. Messages from the AT-60SL's expression pedal and PC Numbers set in the Registrations are transmitted on the Control channel. The channels used for transmission can be changed individually for each Registration. For instructions on how to change the transmission channels, refer to the Owner's Manual.

Channel	(default)	Content Transmitted
Upper	(4)	Key information from the Upper keyboard is transmitted.
Lower	(3)	Key information from the Lower keyboard is transmitted.
Pedal	(2)	Performance information from the pedalboard is transmitted.
Solo	(1)	When "Solo to Lower" is set to ON, Solo part key information from the Upper keyboard is transmitted.
Control	(16)	Expression pedal information and PC Numbers set in the Registrations are transmitted.

* The PC Number is transmitted when Send PC Switch is set to ON.

* For more details regarding the data that is transmitted, refer to "Transmit data" (p. 7).

3. Receive Data

[GM2] ... This indicates reception when GM2 Mode is enabled. To switch to GM2 Mode, use GM2 System On (p. 5).

[GM1] ... This indicates reception when GM1 Mode is enabled. To switch to GM1 Mode, use GM1 System On (p. 5).

[GS] ... This indicates reception when GS Mode is enabled. To switch to GS Mode, use GS Reset (p. 5).

[AT] ... This indicates reception for the keyboard part when MIDI IN Mode is set to MODE 2. For more information about the keyboard parts, refer to the section on "Receive Channel" (p. 1).

* Not Received in Keyboard Part.

NRPN

The NRPN (Non Registered Parameter Number) message allows an extended range of control changes to be used.

To use these messages, you must first use NRPN MSB and NRPN LSB messages to specify the parameter to be controlled, and then use Data Entry messages to specify the value of the specified parameter. Once an NRPN parameter has been specified, all Data Entry messages received on that channel will modify the value of that parameter. To prevent accidents, it is recommended that you set RPN Null (RPN Number = 7FH/7FH) when you have finished setting the value of the desired parameter. Refer to Section 6. Supplementary material "Examples of actual MIDI messages" <Example 4> (p. 16) On the GS devices, Data entry LSB (llH) of NRPN is ignored, so it is no problem to send Data entry MSB (mmH) only (without Data entry LSB).

On the AT-60SL, NRPN can be used to modify the following parameters.

NRPN MSB LSB	Data entry MSB	Description
01H 08H	mmH	Vibrato rate (relative change on specified channel) mm: 0EH-40H-72H (-50 - 0 - +50)

* Parameters marked "absolute change" will be set to the absolute value of the parameter,

regardless of the preset value.

○**RPN MSB/LSB (Controller number 100, 101)**

Status	2nd bytes	3rd byte
BnH	65H	mmH
BnH	64H	llH

n = MIDI channel number: 0H-FH (ch.1-ch.16)
mm = upper byte of parameter number specified by RPN
ll = lower byte of parameter number specified by RPN

* Not received when Rx.RPN = OFF. (Initial value is ON)
* The value specified by RPN will not be reset even by messages such as Program Change or Reset All Controller.

RPN

The RPN (Registered Parameter Number) messages are expanded control changes, and each function of an RPN is described by the MIDI Standard.

To use these messages, you must first use RPN MSB and RPN LSB messages to specify the parameter to be controlled, and then use Data Entry messages to specify the value of the specified parameter. Once an RPN parameter has been specified, all Data Entry messages received on that channel will modify the value of that parameter. To prevent accidents, it is recommended that you set RPN Null (RPN Number = 7FH/7FH) when you have finished setting the value of the desired parameter.Refer to Section 6. "Examples of actual MIDI messages" <Example 4> (p. 16).

On the AT-60SL, RPN can be used to modify the following parameters.

The System Exclusive Messages received by the AT-60SL are; messages related to mode settings, Universal Realtime System Exclusive messages and Data Set (DT1).

●System exclusive messages related to mode settings

These messages are used to initialize a device to GS or General MIDI mode, or change the operating mode.
When creating performance data, a "GM2 System On" or "GM1 System On" message should be inserted at the beginning of a General MIDI score, and a "GS Reset" message at the beginning of a GS music data. Each song should contain only one mode message as appropriate for the type of data. (Do not insert two or more mode setting messages in a single song.)

❍Data transmission

AT-60SL can receive the various parameters using System Exclusive messages.
The exclusive message of GS format data has a model ID of 42H and a device ID of 10H (17), and it is common to all the GS devices.
When keyboard part in MIDI-IN Mode: Mode-2, the exclusive message has a model ID of 62H and a device ID of 10H (17).

❍Data set 1 DT1

This is the message that actually performs data transmission, and is used when you wish to transmit the data.

F7H	EOX (End Of Exclusive)

* The amount of data that can be transmitted at one time depends on the type of data, and data can be received only from the specified starting address and size. Refer to the Address and Size given in Section 3 (p. 1).

* Data larger than 128 bytes must be divided into packets of 128 bytes or less. If "Data Set 1" is transmitted successively, there must be an interval of at least 40 ms between packets.

* Regarding the checksum please refer to section 4 (p. 7).

4. Transmit data

Arranger and composer data can not be transmitted.

5. Parameter Address Map

This map indicates address, size, Data (range), Parameter, Description, and Default Value of parameters which can be transferred using and "Data set 1 (DT1)."

All the numbers of address, size, Data, and Default Value are indicated in 7-bit Hexadecimal-form.

■Address Block map (GS Part: Model ID = 42H)

An outlined address map of the Exclusive Communication is as follows;

```
Address (H) Block
40 00 00   +----------------------+
           | SYSTEM PARAMETERS    | Individual
40 01 3F   +----------------------+
40 1x 00   +----------------------+
           | PART  PARAMETERS     | Individual
           | (x = 0-F)            |

           | (m = 0-1)            |
49 mE 17   +----------------------+
```
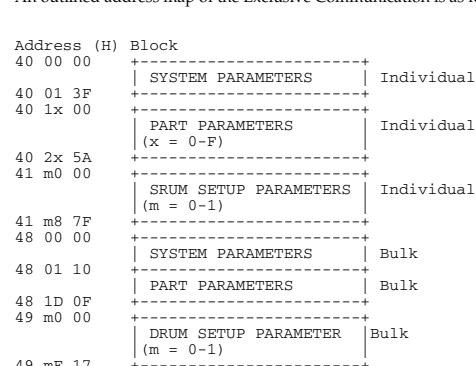

There are two ways in which GS data is transmitted: Individual Parameter Transmission in which individual parameters are transmitted one by one, and Bulk Dump Transmission in which a large amount of data is transmitted at once.

■Individual Parameters

Individual Parameter Transmission transmits data (or requests data) for one parameter as one exclusive message (one packet of "F0 ..... F7").
In Individual Parameter Transmission, you must use the Address and Size listed in the following "Parameter Address Map." Addresses marked at "#" cannot be used as starting addresses.

●System Parameters [Keyboard Part: Model ID = 62H]

REVERB MACRO is a macro parameter that allows global setting of reverb parameters. When you select the reverb type with REVERB MACRO, each reverb parameter will be set to the most suitable value.
REVERB CHARACTER is a parameter that changes the reverb algorithm. The value of REVERB CHARACTER corresponds to the REVERB MACRO of the same number.

CHORUS MACRO is a macro parameter that allows global setting of chorus parameters. When you use CHORUS MACRO to select the chorus type, each chorus parameter will be set to the most suitable value.

●Part Parameters [GS Part: Model ID = 42H]

AT-60SL has 16 parts. Parameters that can be set individually for each Part are called Part parameters.
If you use exclusive messages to set Part parameters, specify the address by Block number rather than Part Number (normally the same number as the MIDI channel). The Block number can be specified as one of 16 blocks, from 0 (H) to F (H).

The relation between Part number and Block number is as follows.

x...BLOCK NUMBER (0-F),Part 1 (MIDI ch = 1) x = 1
                Part 2 (MIDI ch = 2) x = 2
                : : :
                Part 9 (MIDI ch = 9) x = 9
                Part10 (MIDI ch = 10) x = 0
                Part11 (MIDI ch = 11) x = A
                Part12 (MIDI ch = 12) x = B
                : : :
                Part16 (MIDI ch = 16) x = F

In the following map, the Control Change controller number is expressed by the CC#.

Address (H)	Size (H)	Data (H)	Parameter	Description	Default Value (H)	Description

			1 = MAP1	01 at x = 0	MAP1 at x = 0	
			2 = MAP2			

This parameter sets the Drum Map of the Part used as the Drum Part. AT-60SL can simultaneously (in different Parts) use up to two Drum Maps (MAP1, MAP2). With the initial settings, Part10 (MIDI CH = 10, x = 0) is set to MAP1 (1), and other Parts are set to normal instrumental Parts (OFF (0)).

40 1x 16	00 00 01	28-58	PITCH KEY SHIFT	-24 - +24 [semitones]	40	0 [semitones]
40 1x 17	00 00 02	08-F8	PITCH OFFSET FINE	-12.0 - +12.0 [Hz]	08 00	0 [Hz]
40 1x 18#			Use nibblized data.			

PITCH OFFSET FINE allows you to alter, by a specified frequency amount, the pitch at which notes will sound. This parameter differs from the conventional Fine Tuning (RPN #1) parameter in that the amount of frequency alteration (in Hertz) will be identical no matter which note is played. When a multiple number of Parts, each of which has been given a different setting for PITCH OFFSET FINE, are sounded by means of an identical note number, you can obtain a Celeste effect.

SCALE TUNING is a function that allows fine adjustment to the pitch of each note in the octave. The pitch of each identically-named note in all octaves will change simultaneously. A setting of ± 0 cent (40H) is equal temperament. Refer to section 6. Supplementary material, "About tuning" (p. 17).

●Decimal and Hexadecimal table

(An `H' is appended to the end of numbers in hexadecimal notation.)

In MIDI documentation, data values and addresses/sizes of Exclusive messages, etc. are expressed as hexadecimal values for each 7 bits. The following table shows how these correspond to decimal numbers.
The following table shows how these correspond to decimal numbers.

31	1FH	63	3FH	95	5FH	127	7FH

* Decimal values such as MIDI channel, bank select, and program change are listed as one (1) greater than the values given in the above table.
* A 7-bit byte can express data in the range of 128 steps. For data where greater precision is required, we must use two or more bytes. For example, two hexadecimal numbers aa bbH expressing two 7-bit bytes would indicate a value of aa x 128 + bb.
* In the case of values which have a ± sign, 00H = -64, 40H = ± 0, and 7FH = +63, so that the decimal expression would be 64 less than the value given in the above chart. In the case of two types, 00 00H = -8192, 40 00H = ±0, and 7F 7FH = +8191. For example if aa bbH were expressed as decimal, this would be aa bbH - 40 00H = aa x 128 + bb - 64 x 128.
* Data marked "nibbled" is expressed in hexadecimal in 4-bit units. A value expressed as a 2-byte nibble 0a 0bH has the value of a x 16 + b.

<Example1> What is the decimal expression of 5AH?

From the preceding table, 5AH = 90

<Example2> What is the decimal expression of the value 12 34H given as hexadecimal for each 7 bits?

From the preceding table, since 12H = 18 and 34H = 52
18 x 128 + 52 = 2356

<Example3> What is the decimal expression of the nibbled value 0A 03 09 0D?

From the preceding table, since 0AH = 10, 03H = 3, 09H = 9, 0DH = 13
((10 x 16 + 3) x 16 + 9) x 16 + 13 = 41885

<Example4> What is the nibbled expression of the decimal value 1258?

```
16) 1258
16)  78 ... 10
16)   4 ... 14
      0 ...  4
```

Since from the preceding table, 0 = 00H, 4 = 04H, 14 = 0EH, 10 = 0AH, the answer is 00 04 0E 0AH.

●Examples of actual MIDI messages

<Example1> 95 3E 5F

9n is the Note-on status, and n is the MIDI channel number. Since 5H = 5, 3EH = 62, and 5FH = 95, this is a Note-on message with MIDI CH = 6, note number 62 (note name is D4), and velocity 95.

<Example2> CE 49

CnH is the Program Change status, and n is the MIDI channel number. Since EH = 14 and 49H = 73, this is a Program Change message with MIDI CH = 15, program number 74 (Flute in GS).

<Example3> EB 00 28

EnH is the Pitch Bend Change status, and n is the MIDI channel number. The 2nd byte (00H = 0) is the LSB and the 3rd byte (28H = 40) is the MSB, but Pitch Bend Value is a signed number in which 40 00H (= 64 x 128 + 0 = 8192) is 0, so this Pitch Bend Value is
28 00H - 40 00H = 40 x 128 + 0 - (64 x 128 + 0) = 5120 - 8192 = -3072
If the Pitch Bend Sensitivity is set to 2 semitones, -8192 (00 00H) will cause the pitch to change -200 cents, so in this case -200 x (-3072) / (-8192) = -75 cents of Pitch Bend is being applied to MIDI channel 12.

<Example4> B6 64 00 65 00 06 0C 26 00 64 7F 65 7F

BnH is the Control Change status, and n is the MIDI channel number. For Control Changes, the 2nd byte is the control number, and the 3rd byte is the value. In a case in which two or more messages consecutive messages have the same status, MIDI has a provision called "running status" which allows the status byte of the second and following messages to be omitted. Thus, the above messages have the following meaning.

B6	64 00	MIDI ch.7, lower byte of RPN parameter number: 00H
(B6)	65 00	(MIDI ch.7) upper byte of RPN parameter number: 00H
(B6)	06 0C	(MIDI ch.7) upper byte of parameter value: 0CH
(B6)	26 00	(MIDI ch.7) lower byte of parameter value: 00H
(B6)	64 7F	(MIDI ch.7) lower byte of RPN parameter number: 7FH
(B6)	65 7F	(MIDI ch.7) upper byte of RPN parameter number: 7FH

In other words, the above messages specify a value of 0C 00H for RPN parameter number 00 00H on MIDI channel 4, and then set the RPN parameter number to 7F 7FH.

RPN parameter number 00 00H is Pitch Bend Sensitivity, and the MSB of the value indicates semitone units, so a value of 0CH = 12 sets the maximum pitch bend range to ±12 semitones (1 octave). (On this instrument the LSB of Pitch Bend Sensitivity is ignored, but the LSB should be transmitted anyway (with a value of 0) so that operation will be correct on any device.)

Once the parameter number has been specified for RPN or NRPN, all Data Entry messages transmitted on that same channel will be valid, so after the desired value has been transmitted, it is a good idea to set the parameter number to 7F 7FH to prevent accidents. This is the reason for the (B6) 64 7F (B6) 65 7F at the end.

It is not desirable for performance data (such as Standard MIDI File data) to contain many events with running status as given in <Example 4>. This is because if playback is halted during the song and then rewound or fast-forwarded, the sequencer may not be able to transmit the correct status, and the sound source will then misinterpret the data. Take care to give each event its own status.

It is also necessary that the RPN or NRPN parameter number setting and the value setting be done in the proper order. On some sequencers, events occurring in the same (or consecutive) clock may be transmitted in an order different than the order in which they were received. For this reason it is a good idea to slightly skew the time of each event (about 1 tick for TPQN = 96, and about 5 ticks for TPQN = 480).

TPQN: Ticks Per Quarter Note

Example of an Exclusive message and calculating a Checksum
Roland Exclusive messages are transmitted with a checksum at the end (before F7) to make sure that the message was correctly received. The value of the checksum is determined by the address and data (or size) of the transmitted exclusive message.

How to calculate the checksum (hexadecimal numbers are indicated by `H')
The checksum is a value derived by adding the address, size and checksum itself and inverting the lower 7 bits.
Here's an example of how the checksum is calculated. We will assume that in the exclusive message we are transmitting, the address is aa bb ccH and the data or size is dd ee ffH.

aa + bb + cc + dd + ee + ff = sum
sum / 128 = quotient ... remainder
128 - remainder = checksum

<Example1> Setting REVERB MACRO to ROOM 3 (GS Part)

According to the "Parameter Address Map," the REVERB MACRO Address is 40 01 30H, and ROOM 3 is a value of 02H. Thus,

F0	41	10	42	12	40 01 30	02	??	F7
(1)	(2)	(3)	(4)	(5)	Address	data	Checksum	(6)

(1) Exclusive Status, (2) ID (Roland), (3) Device ID (17), (4) Model ID (GS),
(5) Command ID (DT1), (6) End of Exclusive

Next we calculate the checksum.

40H + 01H + 30H + 02H = 64 + 1 + 48 + 2 = 115 (sum)
115 (sum) / 128 = 0 (quotient) ... 115 (remainder)
checksum = 128 - 115 (remainder) = 13 = 0DH

This means that F0 41 10 42 12 40 01 30 02 0D F7 is the message we transmit.

<Example2>

With "Grand Piano" set as the tone for the Upper Orchestral part

*   Keyboard part tone settings are enabled when MIDI IN Mode is set to MODE 2.

According to the "Parameter Address Map," since the address for the tone number in the upper part information for the part parameter [Keyboard Part] is 01 0p 01H and the Orchestral Part Offset Value is p = 3, the address is then 01 03 01H. Since the tone map (Keyboard part) (p. 17) gives TONE NUMBER = 38H, BANK SELECT MSB = 02H, BANK SELECT LSB = 00H for the "Grand Piano" tone number, (we get the following):

FO	41	10	62	12	01 03 01	38 02 00	??	F7
(1)	(2)	(3)	(4)	(5)	Address	data	Checksum	(6)

(1) Exclusive Status, (2) ID (Roland), (3) Device ID (17), (4) Model ID (Atelier), (5) Command ID (DT1), (6) End of Exclusive

Next we calculate the checksum.

01H + 03H + 01H + 38H + 02 + 00H = 1 + 3 + 1 + 56 + 2 + 0 = 63 (sum)
63 (sum) / 128 = 0 (quotient) ... 63 (remainder)
checksum = 128 - 63 (remainder) = 65 = 41H

This means that F0 41 10 62 12 01 03 01 38 02 00 41 F7 is the message we transmit.

●About tuning

In MIDI, individual Parts are tuned by sending RPN #1 (Master Fine Tuning) to the appropriate MIDI channel.
In MIDI, an entire device is tuned by either sending RPN #1 to all MIDI channels being used, or by sending a System Exclusive MASTER TUNE (address 40 00 00H).
RPN #1 allows tuning to be specified in steps of approximately 0.012 cents (to be precise, 100/8192 cent), and System Exclusive MASTER TUNE allows tuning in steps of 0.1 cent. One cent is 1/100th of a semitone.
The values of RPN #1 (Master Fine Tuning) and System Exclusive MASTER TUNE are added together to determine the actual pitch sounded by each Part.

Frequently used tuning values are given in the following table for your reference. Values are in hexadecimal (decimal in parentheses).

```

<Example> Set the tuning of MIDI channel 3 to A4 = 442.0 Hz

Send RPN#1 to MIDI channel 3. From the above table, the value is 45 03H.
